

Activity 4 – Set up and run a realistic configuration

1. Download the croco tools and datasets

- copy the CROCO_TOOLS package from:

<https://www.croco-ocean.org/download/croco-project/>

or

http://jgula.fr/ModNum/croco_tools-v1.1.tar.gz

or

[/forums/public/pub/Data/croco_tools-v1.1.tar.gz](#)

- We are going to use the Matlab version. Untar the folder and copy the files `croco_tools/start.m` and `croco_tools/crocotools_param.m` in your working folder (e.g. `~/ModNum/myconfig`)
- edit the `start.m` and modify the path to the `croco_tools` routines if needed
- Download datasets (COADS + WOA + Topo) from

<https://www.croco-ocean.org/download/datasets/>

or

<https://filesender.renater.fr/?s=download&token=fbe1f803-c5cb-26d6-80d4-46d0fc24ce47>

or

use the ones already in [/forums/public/pub/Data/](#)

- Edit the `crocotools_param.m` to and modify the path to the data files (variable `DATADIR`)

2. Create files for the Benguela test-case

See https://croco-ocean.gitlabpages.inria.fr/croco_doc/ for a detailed tutorial

In brief you need to :

- start matlab and run `start.m` to load all path
- run the following scripts:
 - `make_grid` to create your grid file [CROCO_FILES/croco_grd.nc]
 - `make_forcing` to generate surface_forcing: wind stress, surface heat flux, surface freshwater flux [CROCO_FILES/croco_frc.nc]
 - `make_clim` to generate initial conditions T, S, currents , SSH [CROCO_FILES/croco_ini.nc and CROCO_FILES/croco_clm.nc]
 - `make_bry` to generate oceanic boundary conditions : T, S, currents , SSH [CROCO_FILES/croco_bry.nc]

3. Compile and run the BENGUELA_LR case

- Use the default `param.h`, `cppdefs.h` and `croco.in`
- Compile and run !

4. Create files for your own configuration

- edit the `crocotools_param.m` to choose all parameters for your configuration (name, grid location and size, time and duration, path to forcing files, etc.)

5. Compile and run your simulation

- Edit the `param.h` to define the size of your grid (and parameters for your parallelization) according to the ones you have chosen in `crocotools_param.m`
- Edit the `cppdefs.h` to choose your numerical options
- Edit the `croco.in` to choose the run time parameters. Choose the parameters to have at least 2 years of simulation with monthly averages (every 30 days).

6. Check your simulation

- Check the circulation:
 - you can use a *python gui*: https://github.com/slgentil/croco_visu
 - you can use the *roms_gui.m* in the `croco_tools` (matlab)
 - you can use python tools (see `Modules.zip`, `Python_example1.py`, `Python_example2.py` on <http://jgula.fr/ModNum>)
- Try to find a paper documenting the circulation in this region and check if it is (at least qualitatively) well reproduced in the simulation.
- Average the simulation over the last year only (*you will consider only the last year of your simulation to minimize the effects of the spin-up.*)
- Plot the mean currents (surface and barotropic) and vertical sections of stratification for your simulation and for observations (*you can use WOA2009 data – or directly use the `croco_clm.nc` file which contains monthly climatology from WOA2009 data interpolated on the model grid.*)
