THE WESTWARD INTENSIFICATION OF WIND-DRIVEN OCEAN CURRENTS

Henry Stommel

(Contribution No. 408, Woods Hole Oceanographic Institution)

Abstract--A study is made of the wind-driven circulation in a homogeneous rectangular ocean under the influence of surface wind stress, linearised bottom friction, horizontal pressure gradients caused by a variable surface height, and Coriolis force.

An intense crowding of streamlines toward the western border of the ocean is discovered to be caused by variation of the Coriolis parameter with latitude. It is suggested that this process is the main reason for the formation of the intense currents (Gulf stream and others) observed in the actual oceans.

Fig. 1--Ocean basin dimensions and the coordinate system

- Momentum equations:

Coriolis   Wind   Drag   Pressure  
gradient

The steady state equations of motion, with the inertial terms omitted because they are small, are written in the form

$$0 = f(D + h)v - I \cos(\pi y/b) Ru - g(D + h)\partial h / \partial x \quad (1)$$

$$0 = -f(D + h)u - Rv - g(D + h)\partial h / \partial x \quad (2)$$

# Stommel's gyre

- No rotation / or constant rotation ( $\frac{\partial f}{\partial y} = \beta = 0$ )

The equation for the stream function is therefore

$$\psi = \gamma(b/\pi)^2 \sin(\pi y/b) [e^{(x-\lambda)\pi/b} + e^{-x\pi/b} - 1]$$

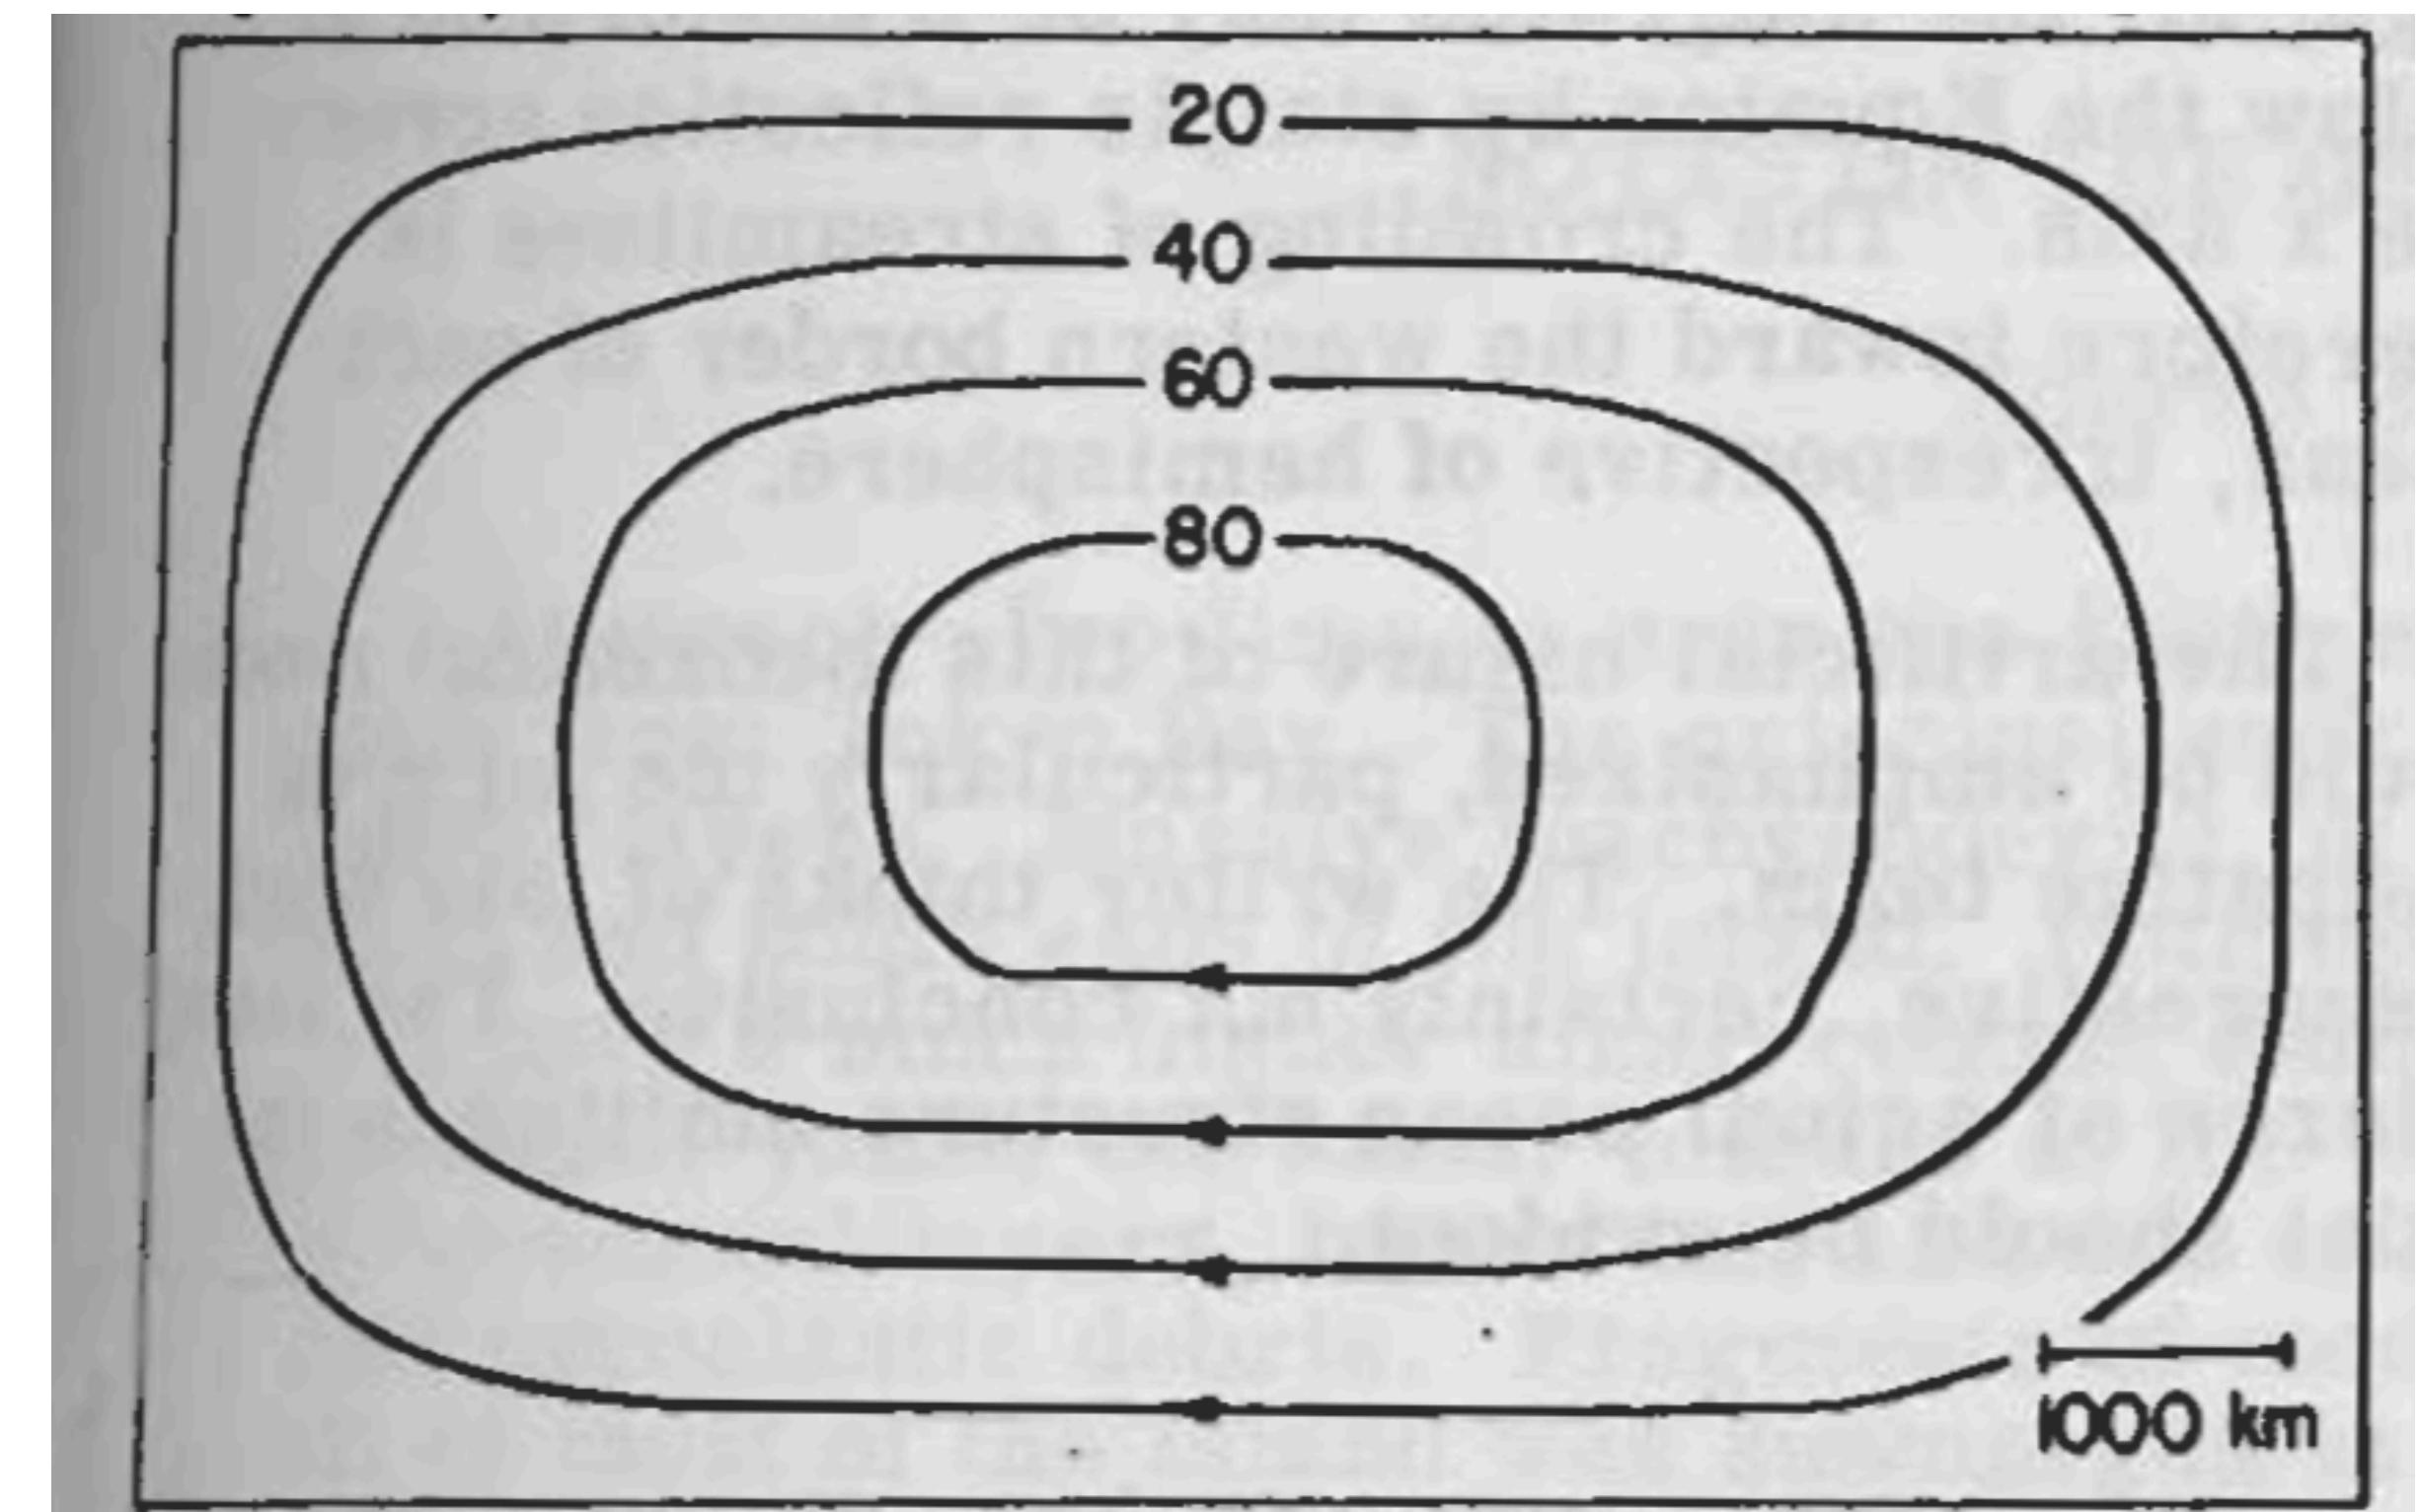

Fig. 2--Streamlines for the case of both the non-rotating and uniformly rotating oceans

# Momentum equations

---

$$\begin{aligned} \frac{\partial u}{\partial t} &= -u_j \frac{\partial u}{\partial x_j} - w \frac{\partial u}{\partial z} + fv - \frac{P_x}{\rho_0} + \mathcal{V}_u + \mathcal{D}_u + \mathcal{S}_u \\ \underbrace{\frac{\partial v}{\partial t}}_{rate} &= -u_j \underbrace{\frac{\partial v}{\partial x_j}}_{hadv} - w \underbrace{\frac{\partial v}{\partial z}}_{vadv} - \underbrace{fu}_{cor} - \underbrace{\frac{P_y}{\rho_0}}_{Prsgrd} + \underbrace{\mathcal{V}_v}_{vmix} + \underbrace{\mathcal{D}_v}_{hmix+hdiff} + \underbrace{\mathcal{S}_v}_{nudg} \end{aligned}$$

# Barotropic vorticity balance

---

- Barotropic vorticity:

$$\Omega = \frac{\partial \bar{v}}{\partial x} - \frac{\partial \bar{u}}{\partial y}$$

with  $\bar{u} = \int_{-h}^{\zeta} u \, dz,$

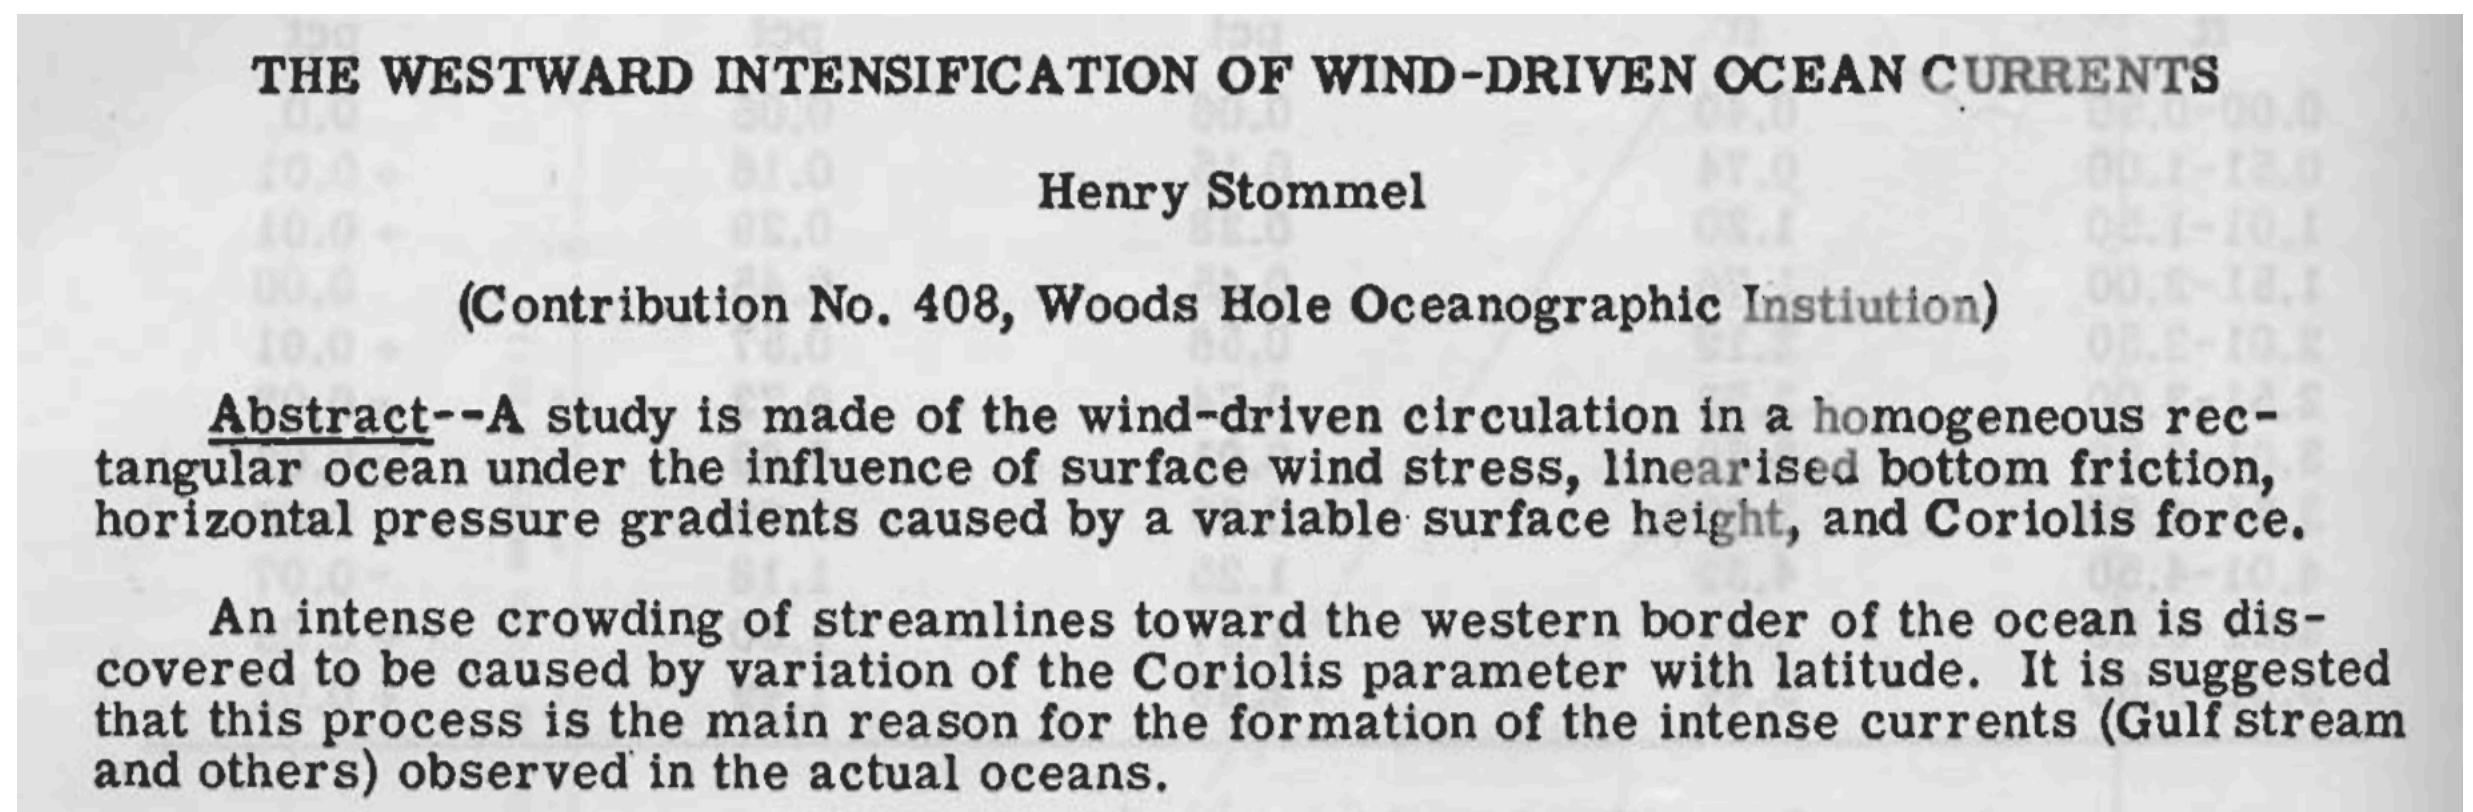

- The barotropic vorticity balance equation of the flow is obtained by integrating the momentum equations in the vertical and cross differentiating them:

- [cf: [https://www.iula.fr/ModNum/vort\\_balance.pdf](https://www.iula.fr/ModNum/vort_balance.pdf)]

$$\underbrace{\frac{\partial \Omega}{\partial t}}_{\text{rate}} = - \underbrace{\vec{\nabla} \cdot (\vec{f} \vec{u})}_{\text{planet. vort. adv.}} + \underbrace{\frac{\mathbf{J}(P_b, h)}{\rho_0}}_{\text{bot. pres. torque}} + \underbrace{\vec{k} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{wind}}{\rho_0}}_{\text{wind curl}} - \underbrace{\vec{k} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{bot}}{\rho_0}}_{\text{bot. drag curl}} + \underbrace{\mathcal{D}_\Sigma}_{\text{horiz. diffusion.}} - \underbrace{A_\Sigma}_{\text{NL advection}}$$

$$A_\Sigma = \frac{\partial^2(\bar{v}\bar{v} - \bar{u}\bar{u})}{\partial x \partial y} + \frac{\partial^2 \bar{u}\bar{v}}{\partial x \partial x} - \frac{\partial^2 \bar{u}\bar{v}}{\partial y \partial y},$$

# Stommel's gyre

JOURNAL OF METEOROLOGY

## ON THE WIND-DRIVEN OCEAN CIRCULATION

By Walter H. Munk

Institute of Geophysics and Scripps Institution of Oceanography, University of California<sup>1</sup>

(Manuscript received 24 September 1949)

$$P = \int_{-h}^{z_0} p dz, \quad \mathbf{M}_H = \int_{-h}^{z_0} \rho \mathbf{v}_H dz, \quad (2a, b)$$

designate the integrated pressure and mass transport.

$$\nabla P + f \mathbf{k} \times \mathbf{M} - \tau - A \nabla^2 \mathbf{M} = 0. \quad \mathbf{M} = \mathbf{k} \times \nabla \psi,$$

$$(A \nabla^4 - \beta \partial / \partial x) \psi = - \text{curl}_z \tau,$$

For boundary conditions we choose

$$\psi_{\text{bdry}} = 0, \quad (\partial \psi / \partial \nu)_{\text{bdry}} = 0, \quad (7a, b)$$

In Ekman's and Stommel's model the ocean is assumed homogeneous, a case in which the currents extend to the very bottom. Not only is this in contrast with observations, according to which the bulk of the water transport in the main ocean currents takes place in the upper thousand meters, but it also leads to mathematical complications which rendered Ekman's

analysis very difficult, and forced Stommel to resort to a rather arbitrary frictional force along the bottom.

To avoid these difficulties, we retain Sverdrup's integrated mass transport as the dependent variable. This device makes it possible to examine the more general case of a baroclinic ocean without having to specify the nature of the vertical distributions of density and current. In recognition of the evidence that currents essentially vanish at great depths, we shall depend on lateral friction for the dissipative forces. From Stommel we retain the rectangular boundaries, although we extend the basin to both sides of the equator and deal with the *observed* wind distribution rather than a simple sinusoidal distribution.

FIG. 8. Schematic presentation of circulation in a rectangular ocean resulting from zonal winds (filled arrowheads), meridional winds (open arrowheads), or both (half-filled arrowheads). The width of the arrows is an indication of the strength of the currents. The nomenclature applies to either hemisphere, but in the Southern Hemisphere the subpolar gyre is replaced largely by the Antarctic Circumpolar Current (west wind drift) flowing around the world. Geographic names of the currents in various oceans are summarized in table 3.

# Leaving flatland!

- The ocean bottom is not flat.
- What happens if we had some topography?

Fig. 6. Heinrich Caesar Berann, 'Northern Atlantic Ocean', 1968. Based on the Heezen–Tharp maps, which by the 1960s came to include all ocean basins, Berann's paintings brought the Heezen–Tharp physiographic diagram to worldwide audiences. Versions of Berann's maps were featured in *National Geographic*; his world oceans depiction became one of the most recognizable maps of the twentieth century. Lateral ridge-bisecting faults (known as transform faults) are depicted here although not in the 1957 map, their existence and extent not yet then discerned. Courtesy <http://www.berann.com>, reproduced with permission.

# Leaving flatland!

A theoretical reason to expect inviscid western boundary currents in realistic oceans

Chris W. Hughes

CCMS-Proudman Oceanographic Laboratory, Bidston Observatory, Bidston Hill, Prenton, Merseyside CH43 7RA, UK

Received 22 August 2000; received in revised form 20 September 2000; accepted 3 October 2000

$$\frac{\partial \Omega}{\partial t}_{\text{rate}} = - \underbrace{\vec{\nabla} \cdot (f \vec{u})}_{\text{planet. vort. adv.}} + \underbrace{\frac{\mathbf{J}(P_b, h)}{\rho_0}}_{\text{bot. pres. torque}} + \underbrace{\vec{\kappa} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{\text{wind}}}{\rho_0}}_{\text{wind curl}} - \underbrace{\vec{k} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{\text{bot}}}{\rho_0}}_{\text{bot. drag curl}}$$

$$+ \underbrace{\mathcal{D}_\Sigma}_{\text{horiz. diffusion.}} - \underbrace{A_\Sigma}_{\text{NL advection}}$$

barotropic vorticity tendency for WBC

# Leaving flatland!

$$\frac{1}{2} \frac{\partial u_i^2}{\partial t} + u_j \frac{\partial \frac{1}{2} u_i^2}{\partial x_j} + w \frac{\partial \frac{1}{2} u_i^2}{\partial z} = - \frac{u_i}{\rho_0} \frac{\partial P}{\partial x_i} + \mathcal{V}_i u_i + \mathcal{D}_i u_i + \mathcal{S}_i u_i$$

# Realistic gyre

- Forcings and data
  - Bottom topography + Land mask
  - Atmospheric surface boundary forcing
  - Initial oceanic conditions
  - Lateral oceanic boundary conditions
- $h(x)$

- **Realistic topography (SRTM30)**

# Realistic gyre

Satellite geodesy data + soundings

- **Climatological fluxes/wind stress**
-

# Realistic gyre

- Surface boundary conditions:

$$\frac{\partial \eta}{\partial t} = w$$

$$K_M v \frac{\partial u}{\partial z} = \frac{\tau_x}{\rho_0}$$

$$K_M v \frac{\partial v}{\partial z} = \frac{\tau_y}{\rho_0}$$

$$K_T v \frac{\partial T}{\partial z} = \frac{Q}{\rho_0 C_p}$$

$$K_S v \frac{\partial S}{\partial z} = \frac{S(E - P)}{\rho_0}$$

Wind stress

Heat flux

Salt flux : evap - rain

## Heat fluxes & Freshwater fluxes:

- Directly read the forcing files
- Or use of a bulk formulae :
  - Heat flux : compute total heat flux from latent, sensible, solar and longwave fluxes and model SST
  - Freshwater flux : compute from evap, prate and model SSS

## Wind stress:

- Directly read the forcing files
- Or compute the windstress from the Cd drag coefficient, model SST and wind (use of bulk formulae)

## + Rivers runoff

## Available Datasets:

- Heat and freshwater fluxes : COADS, ...
- Wind Stress: QuickScat, SCOW, ...
- Reanalysis (Model +obs.) : CFSR, ERA interim, etc.

# Realistic gyre

# Realistic gyre

- Standard choices:

- **cppdefs.h** (open boundary conditions)

```
# define OBC_EAST  
# define OBC_WEST  
# define OBC_NORTH  
# define OBC_SOUTH
```

```
# define FRC_BRY  
# define OBC_M30RLANSKI  
# define OBC_TORLANSKI
```

```
# define SPONGE
```

Adaptative mixed radiations/nudging open boundary conditions  
[Marchesiello et al, Ocean Modelling, 2001].

$$\frac{\partial \phi}{\partial t} + c_x \frac{\partial \phi}{\partial x} + c_y \frac{\partial \phi}{\partial y} = -\frac{1}{\tau}(\phi - \phi_{ext})$$

Adaptative nudging term :

**Adaptativity**

- Ingoing signal ( $C_x > 0$ ) : strong nudging toward external data using
- Outgoing signal ( $C_x > 0$ ) : weak nudging toward ext. Data

- Sponge : Additional viscosity/diffusivity
- Nudging : optionally Add a weak nudging, , toward a reference

# Realistic gyre

---

- Ex: ATLBIG simulation (res = 5-6 km)
- Forced with climatological wind stress/fluxes

# Realistic gyre

- How realistic is it?
- What kind of diagnostics can we do?

# Realistic gyre

# Leaving flatland!

$$\underbrace{\frac{\partial \Omega}{\partial t}}_{\text{rate}} = - \underbrace{\vec{\nabla} \cdot (\vec{f} \vec{u})}_{\text{planet. vort. adv.}} + \underbrace{\frac{\mathbf{J}(P_b, h)}{\rho_0}}_{\text{bot. pres. torque}} + \underbrace{\vec{k} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{wind}}{\rho_0}}_{\text{wind curl}} - \underbrace{\vec{k} \cdot \vec{\nabla} \times \frac{\vec{\tau}^{bot}}{\rho_0}}_{\text{bot. drag curl}}$$
